Note

The CD3-T cell receptor (TCR) complex plays a central role in the recognition of the antigens and subsequent signal transduction and activation of immunocompetent T lymphocytes. There are two types of TCR differentiated by their heterodimers, namely TCR $\alpha\beta$ and TCR $\gamma\delta$. The CD3 antigen is comprised of multiple subunits (CD3 γ , CD3 δ , CD3 ϵ , and CD3 ζ). The variable immunoglobulin domains of TCR $\alpha\beta$ (TCR $\gamma\delta$) bind to the ligand, whereas the cytoplasmic tails of the CD3 subunits interact with cytosolic-signalling proteins.

This antibody is specific to human T cell associated-antigen and will be useful for detection of normal peripheral blood T cells, some neoplastic T cells in human.

T細胞受容体-CD3複合体は、抗原の認識、細胞内シグナル伝達、Tリンパ球活性化に中心的な役割を果たしています。T細胞受容体 (TCR) には2種類のヘテロ二量体 (TCR $\alpha\beta$ TCR $\gamma\delta$) が存在し、CD3はCD3 γ 、CD3 δ 、CD3 ϵ 、CD3 ζ からなるタンパク質複合体です。TCR $\alpha\beta$ (TCR $\gamma\delta$)は、その可変領域で抗原を認識し、一方CD3は抗原認識シグナルを細胞内に伝達する役割を担っています。

本抗体は、ヒトT細胞レセプター関連抗原に特異的な抗体であり、正常末梢血T細胞及び一部のT細胞腫瘍の検出に使用できます。
