QMTT Cell Viability Assay Kits
Non-radioactive Colorimetric Assay for Cell Proliferation and Cytotoxicity

DESCRIPTION
The study of cell proliferation and cell viability requires the accurate quantification of the number of viable cells in a given culture. This homogeneous colorimetric assay is based on the conversion of a tetrazolium salt MTT, a pale yellow substrate, to formazan, a purple dye. This cellular reduction reaction involves the pyridine nucleotide cofactors NADH/NADPH and is only catalyzed by living cells. The formazan product has a low aqueous solubility and is present as purple crystals. Dissolving the resulting formazan with a solubilization buffer permits the convenient quantification of product formation. The intensity of the product color, measured at 550 - 620 nm, is directly proportional to the number of living cells in the culture. Reagents in the kit have been carefully formulated and optimized for sensitivity, assay robustness and automation.

KEY FEATURES
Safe. Non-radioactive assay (cf. ³H-thymidine incorporation assay).
Sensitive and accurate. As low as 950 cells can be accurately quantified.
Fast. High-throughput assay using 96-well plates allows simultaneous processing tens of thousands of samples per day.
Homogeneous and convenient. "Mix-incubate-measure" type assay. No wash and reagent transfer steps are involved.
Robust and amenable to HTS. Z’ factors of 0.5 and above are observed. Can be readily automated with HTS liquid handling systems.

APPLICATIONS
Cell Proliferation: effects of cytokines, growth factor, and nutrients.
Cytotoxicity and Apoptosis: evaluation of toxic compounds, anti-cancer antibodies, toxins, environmental pollutants etc.
Drug Discovery: high-throughput screen for toxic and anticancer drugs.

Control Reagent (Cat # Z5030008): 50 mg saponin (to be ordered separately).

Storage conditions. Store the Reagent at -20 °C. Keep Assay Buffer and Solubilization Solution at 4 °C and room temperature, respectively. Shelf life: 12 month.

This protocol can be downloaded online at www.biochain.com.

Precautions: reagents are for research use only. Normal precautions for laboratory reagents should be exercised while using the reagents. Please refer to Material Safety Data Sheet for detailed information.

PROCEDURES
The QMTT assay is based on the conversion of MTT to purple formazan by metabolically active cells. For most cells, this reducing reaction takes 3 to 5 hours. The produced formazan is solubilized and the resulting colored solution is quantified with a microplate reader. Although most culture media contain phenol red, phenol red does not interfere with the assay. All data in Technical Notes were obtained in culture media containing phenol red.

Procedure using 96-well plate:
1. Plate and culture cells (80 µL per well) in a clear bottom 96-well tissue culture plates. Typical culture medium contains DMEM, 10% fetal bovine serum, antibiotics (penicillin/streptomycin, gentamycin, etc), amino acids and other nutrients. Assays can be performed on either adherent cells or cells in suspension. The number of cells can vary from 1,000 to 80,000 per well. The volume can vary from 50 to 150 µL, although 80 µL is used in this example. In addition to the test samples, one must include control wells of culture medium containing no cells or cells treated with a toxic reagent such as 0.1% saponin.

2. Add test compounds and controls and incubate cells for the desired period of time (typically overnight). It is recommended that assays be run in duplicate or triplicate. A volume of 20 µL in phosphate buffered saline (PBS) or culture medium is recommended for the test compounds and controls. The Control reagent can be conveniently reconstituted with 5 mL PBS (1% saponin).

3. Reconstitute the QMTT Reagent with Assay Buffer. First equilibrate the Reagent and Assay Buffer to room temperature. Then simply combine Assay Buffer and the Reagent by pipetting a small volume (e.g. 1 mL) buffer to the Reagent tube. Vortex briefly and pipet the reconstituted solution to the Assay Buffer bottle. Repeat this step to transfer all reagent to the Assay Buffer bottle. Mix by inversion until the Reagent is thoroughly dissolved. After this is done, mark the bottle label as Reconstituted Reagent. Note: Fresh reconstitution is recommended although the reconstituted reagent is stable for up to 4 weeks when stored at -20 °C.

4. Add 15 µL (per 80 µL cell culture) of QMTT reagent per well and incubate for 4 hours at 37°C. The volume of the reagent should be adjusted depending on the volume of cell culture.

5. Add 100 µL of the Solubilization Solution. Mix gently on an orbital shaker for one hour at room temperature. The volume of the Solubilization Solution should be adjusted depending on the volume of cell culture. If precipitation occurs in the Solubilization Solution, place the bottle in a warm water bath or at 37°C and shake to dissolve precipitates.

6. Measure OD₅₇₀nm for each well on an absorbance plate reader. Maximum absorbance of the formazan dye lies between 560 and 590 nm. If desired, the OD measurement can be performed the following day. In this case, it is recommended to seal the plate to minimize evaporation.

DATA ANALYSIS
Determine the average of the blank controls and subtract this amount from all absorbance values. Plot the corrected absorbance values at 570nm against the concentration of the test compound. Determine the EC50 value for cell proliferation and IC50 value for cytotoxic compound by non-linear regression analysis using Prism or any other data analysis tool.

**Screening for cytotoxic compounds**

**TECHNICAL NOTES**

The QMTT assay kit provides a convenient and homogeneous assay for cell proliferation and cytotoxicity in multi-well plates. Reagents of the kit have been carefully formulated and optimized for sensitivity, assay robustness and automation. Key features of the kits include:

- **Safe.** Non-radioactive assay (cf. 3H-thymidine incorporation assay).
- **Sensitive and accurate.** As low as 950 cells can be accurately quantified.
- **Fast.** High-throughput assay using 96-well plates allows simultaneous processing tens of thousands of samples per day.
- **Homogeneous and convenient.** "Mix-incubate-measure" type assay. No wash and reagent transfer steps are involved.
- **Robust and amenable to HTS.** Z’ factors of 0.5 and above are observed. Can be readily automated with HTS liquid handling systems.
