Hyaluronan oligosaccharides are known for their various activities depending on the size as reported by Stern R. et al<sup>1)</sup>. Hyaluronan oligosaccharides are made by an enzyme, hyaluronidase, from hyaluronan polymer extracted from rooster comb or isolated from fermentation products of bacteria. There is a difference between the structure of hyaluronan oligosaccharides made by manmmalian enzyme and by bacterial enzyme.

Oligosaccharides made by hyaluronidase derived from bacteria are called "unsaturated" oligosaccharides because of the double bond between C-4 and C-5 position of uronic acid at their non-reducing end. On the other hands, oligosaccharides made by hyaluronidase derived from mammalian testis are called "saturated" oligosaccharide because they have no unsaturated bound.

This product is made from hyaluronan polymer purified from fermentation products of streptococcus sp, by digestion with mammalian hyaluronidase derived from ovine testis, and purified by the column chromatography<sup>2)</sup>. The structure of this product is shown in the chart below.
