The Human Fibrinogen, Plasminogen and vWF Depleted is homogeneous as judged on a 4-20% gradient gel and is greater than 95% clottable. The plasminogen and von Willebrand Factor were depleted using affinity chromatography. We suggest thawing the protein in a 37C water bath, aliquoting and refreezing the unused portion. The above protein was purified from Human plasma that was tested and found negative for HIV-1, HIV-2, Hepatitis B Surface antigen and HCV. Donors are screened for CJD (Creutzfeldt-Jakob Disease).
