The QS-710 has been designed by users for rapid electrophoresis. The maximum suggested applied voltage for the electrophoresis of DNA in agarose gels, using the QS-710, is 100 volts. In a 1% TBE gel, this translates into a run time of approximately 1 hour. Lower voltages may be used, of course, and as a general rule a 50 volt run will take twice as long as a 100 volt run. Higher voltages may be used to decrease the run time; however, if the unit is being operated at higher voltages the heat generated during electrophoresis may decrease sample resolution. Such artifacts may be avoided by running the unit in a cold room or by adding 1X electrophoresis buffer "ice cubes" to keep the unit properly cooled.

The suggested run parameters for the electrophoresis of RNA in agarose gels containing formaldehyde is 60-80 volts. Since the QS-710 has no capacity for buffer recirculation, the buffer from each reservoir should be collected after 1.5 hours of electrophoresis.

The IB51000 has a patented vented lid. Patent# 5,779,869.
